

Lakeside's Premium Fertilizer Product Portfolio

Dave Curry CCA-ON

The team here at Lakeside Grain and Feed view themselves as leaders and innovators when it comes to fertilizer products. We have access to a broad spectrum of dry fertilizer products that allow us to tailor make any fertility blend that our customers are looking for. Helping our customers produce the highest yield with the most economic value is what we are trying to achieve. Consider looking at some of the following products this year when planning your fertilizer needs for next season.

MESZ (12-40-0 10S 1Zn)

Micro Essentials from the Mosaic company is a premium phosphate-based product with a uniform blend of phosphorus, sulphur and zinc.

This product is ideally suited for corn planter mixes or strip till situations. The uniform mix of available phosphorus, sulphur and zinc is exactly what a young corn seedling requires to build that top yield potential early in the spring.

This product is an excellent positioned fertilizer source for farmers looking to add a uniform amount of zinc to their fertilizer broadcast

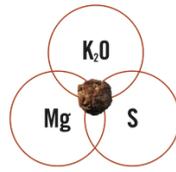

NK 21 (21-0-21)

NK 21 is a unique product of equal parts nitrogen and potassium. This low salt fertilizer product is readily available to the crop right at the time of application. Safety and yield response is the name of the game with NK 21. A corn planter mix with NK 21 is a great way to get safe nitrogen in the starter band with a low salt highly available form of potassium to give that young seedling the boost it requires.

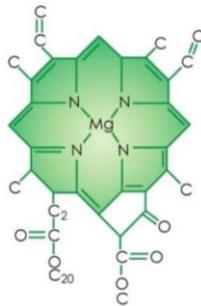

KMAG (0-0-22 22S 11Mg)

K:Mag

KMAG or sometimes known as Sulpomag is a premium potassium fertilizer source providing highly available potassium, sulphur and magnesium. Ideally it is applied in the spring to maximize the sulphate sulphur available to the growing crop.

Emerald (17.5S 17.5Mg)

Plant Chlorophyll

Emerald is a dry fertilizer product that will green up your fields. It is very safe and highly compatible for corn planter mixes and one of the most economic ways to get a solid shot of available magnesium and sulphur on those low testing soil types. This product blends extremely well to have a great fit in a planter mix.

Pur Yield (45-0-0)

Pur Yield is an advanced coated urea technology that brings you slow release nitrogen and big economic yield responses to your corn, dry beans and vegetable crops with slightly higher percentage nitrogen compared to ESN at a better economic value.

This product is usually looked at in a percentage blend with other sources of nitrogen to give the farmer season long nitrogen to keep the plants fed to the finish line.

Contact your Lakeside representative to discuss options to look at some of these premium fertilizer products this spring. We can help tailor the ideal broadcast or starter blend that suits your crop and soil test needed to maximize economic yield return on the farm.
